INFORMATION FOR PHARMACISTS

Do you see patients at risk of an opioid overdose?

NARCAN® NASAL SPRAY INDICATIONS AND IMPORTANT SAFETY INFORMATION

INDICATIONS

NARCAN® (naloxone hydrochloride) Nasal Spray is an opioid antagonist indicated for the emergency treatment of known or suspected opioid overdose, as manifested by respiratory and/or central nervous system depression. NARCAN® Nasal Spray is intended for immediate administration as emergency therapy in settings where opioids may be present.

NARCAN® Nasal Spray is not a substitute for emergency medical care.

IMPORTANT SAFETY INFORMATION

NARCAN® Nasal Spray is contraindicated in patients known to be hypersensitive to naloxone hydrochloride. Seek emergency medical assistance immediately after initial use, keeping the patient under continued surveillance.

Please see additional Important Safety Information on subsequent pages.
**RISK FACTORS**

Before starting and periodically during continuation of opioid therapy, healthcare professionals should evaluate risk factors for opioid-related harms. Incorporate into the management plan strategies to mitigate risk, including offering naloxone when the following factors that increase risk for opioid overdose are present:*6,7

- Use of prescription opioids, especially doses ≥50 morphine milligram equivalents MME/daily
- Use of opioids in combination with other sedating substances, such as benzodiazepines
- A suspected or confirmed history of substance abuse, dependence or non-medical use of prescription or illicit opioids

For these patients, **recommend that an emergency treatment for opioid overdose be in their home or with a caregiver/loved one.**

**IMPORTANT SAFETY INFORMATION**

**Risk of Recurrent Respiratory and CNS Depression:** Due to the duration of action of naloxone relative to the opioid, keep the patient under continued surveillance and administer repeat doses of naloxone using a new nasal spray with each dose, as necessary, while awaiting emergency medical assistance.

**Risk of Limited Efficacy with Partial Agonists or Mixed Agonists/Antagonists:** Reversal of respiratory depression caused by partial agonists or mixed agonists/antagonists, such as buprenorphine and pentazocine, may be incomplete. Larger or repeat doses may be required.

**IMPORTANT SAFETY INFORMATION**

**Precipitation of Severe Opioid Withdrawal:** Use in patients who are opioid dependent may precipitate opioid withdrawal characterized by body aches, fever, sweating, runny nose, sneezing, goose bumps (piloerection), yawning, weakness, shivering or trembling, nervousness, restlessness or irritability, diarrhea, nausea or vomiting, abdominal cramps, increased blood pressure and increased heart rate (tachycardia). In some patients, there may be aggressive behavior upon abrupt reversal of an opioid overdose. In neonates, opioid withdrawal may be life-threatening if not recognized and properly treated and may be characterized by convulsions, excessive crying, and hyperactive reflexes. Monitor for the development of opioid withdrawal.

Please see additional Important Safety Information on subsequent pages.
STARTING THE CONVERSATION

The word “overdose” can have a negative connotation and patients who take prescription opioids may not relate to it, or think it could not happen to them. When talking to patients, consider using language like “accidental overdose.” You may also consider saying:

- “Opioids can sometimes slow or even stop your breathing”
- “Naloxone can help reverse an opioid overdose - it can be administered intranasally if you accidently take too much and can’t be woken up”
- “Family members, caregivers, or other people who may have to use NARCAN® Nasal Spray in an opioid emergency should know where NARCAN® Nasal Spray is stored and how to give NARCAN® before an emergency happens”
- “NARCAN® is not a substitute for emergency medical care; it is important to get emergency medical help right away after giving the first dose. Repeated doses may be necessary”

IMPORTANT SAFETY INFORMATION

Risk of Cardiovascular (CV) Effects: Abrupt postoperative reversal of opioid depression may result in adverse CV effects. These events have primarily occurred in patients who had pre-existing CV disorders or received other drugs that may have similar adverse CV effects. Monitor these patients closely in an appropriate healthcare setting after use of naloxone hydrochloride.

The following adverse reactions were observed in a NARCAN Nasal Spray clinical study: increased blood pressure, constipation, toothache, muscle spasms, musculoskeletal pain, headache, nasal dryness, nasal edema, nasal congestion, nasal inflammation, rhinalgia, and xeroderma.

WHAT IS NARCAN® NASAL SPRAY 4mg?

NARCAN® (naloxone HCl) Nasal Spray is the first and only FDA-approved nasal form of naloxone for the emergency treatment of a known or suspected opioid overdose.

NARCAN® Nasal Spray counteracts the life-threatening effects of opioid overdose. Making naloxone available in the home setting provides the opportunity for family members, friends or caregivers to intervene with this potentially life-saving medication.

NARCAN® Nasal Spray:

- Designed for ease-of-use*
- Has a 4 mg concentrated dose
- Needle-free
- Requires no specialized training†

Not a substitute for emergency medical care. Repeated doses may be necessary.

*Administer in accordance with the Instructions for Use.

NARCAN® Nasal Spray is contraindicated in patients known to be hypersensitive to naloxone hydrochloride. Seek emergency medical assistance immediately after initial use, keeping the patient under continued surveillance.

IMPORTANT SAFETY INFORMATION

Additional information, including full Prescribing Information for NARCAN® Nasal Spray, and Important Safety Information and Instructions for Use, is also available at www.NARCAN.com.

To report SUSPECTED ADVERSE REACTIONS, contact Adapt Pharma, Inc. at 1-844-4NARCAN (1-844-462-7226) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

Please see additional Important Safety Information on subsequent pages.
OBTAINING NARCAN® NASAL SPRAY 4mg

State-specific regulations regarding naloxone vary significantly. In many states, residents can purchase directly from a pharmacist under a state Standing Order or Collaborative Practice Order. NARCAN® Nasal Spray is available through most major distributors or you can contact Adapt Customer Service at: (1-844-4NARCAN) or 844-462-7226.

IMPORTANT SAFETY INFORMATION

Precipitation of Severe Opioid Withdrawal: Use in patients who are opioid dependent may precipitate opioid withdrawal characterized by body aches, fever, sweating, runny nose, sneezing, goose bumps (piloerrection), yawning, weakness, shivering or trembling, nervousness, restlessness or irritability, diarrhea, nausea or vomiting, abdominal cramps, increased blood pressure and increased heart rate (tachycardia). In some patients, there may be aggressive behavior upon abrupt reversal of an opioid overdose. In neonates, opioid withdrawal may be life-threatening if not recognized and properly treated and may be characterized by convulsions, excessive crying, and hyperactive reflexes. Monitor for the development of opioid withdrawal.

HOW TO EDUCATE PATIENTS ON NALOXONE

Pharmacists are an important resource to help educate appropriate, at-risk patients taking prescription opioids.

You and your staff can educate patients about naloxone and its availability. Education generally includes:  
- Informing patients about the pharmacologic properties of naloxone  
- When to administer naloxone  
- How to administer naloxone  
- Informing patients to alert others about the medication, how to use it and where it’s kept, as it is generally not self-administered  
- Discussing the red-flag symptoms that indicate opioid overdose  
- Discussing that the following adverse reactions were observed in a NARCAN® Nasal Spray clinical study: increased blood pressure, constipation, toothache, muscle spasms, musculoskeletal pain, headache, nasal dryness, nasal edema, nasal congestion, nasal inflammation, rhinalgia, and xeroderma

IMPORTANT SAFETY INFORMATION

Risk of Cardiovascular (CV) Effects: Abrupt postoperative reversal of opioid depression may result in adverse CV effects. These events have primarily occurred in patients who had pre-existing CV disorders or received other drugs that may have similar adverse CV effects. Monitor these patients closely in an appropriate healthcare setting after use of naloxone hydrochloride.

The following adverse reactions were observed in a NARCAN Nasal Spray clinical study: increased blood pressure, constipation, toothache, muscle spasms, musculoskeletal pain, headache, nasal dryness, nasal edema, nasal congestion, nasal inflammation, rhinalgia, and xeroderma.

RECOGNITION OF OPIOID OVERDOSE

Inform patients and their family members, friends or caregivers about how to recognize the signs and symptoms of an opioid overdose:  
- Snoring, gasping, or gurgling  
- Blue or purple fingernails or lips  
- Extreme somnolence - inability to awaken a patient verbally or upon a firm sternal rub  
- Respiratory depression - this can range from slow or shallow respiration to no respiration in a patient unable to awaken

Other signs and symptoms that may accompany somnolence and respiratory depression include the following:  
- Miosis  
- Bradycardia and/or hypotension

Advise the patient, family members or caregivers to read the Patient Information section in the NARCAN® Nasal Spray full Prescribing Information.

IMPORTANT SAFETY INFORMATION

Additional information, including full Prescribing Information for NARCAN® Nasal Spray, and Important Safety Information and Instructions for Use, is also available at www.NARCAN.com.

To report SUSPECTED ADVERSE REACTIONS, contact Adapt Pharma, Inc. at 1-844-4NARCAN (1-844-462-7226) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

Please see additional Important Safety Information on subsequent pages.
RECOGNITION OF OPIOID WITHDRAWAL AFTER RECEIVING NALOXONE

Patients should be aware that in some patients, especially those with opioid dependence, there may be aggressive behavior upon abrupt reversal of opioid overdose. Naloxone may cause serious side effects, including sudden opioid withdrawal symptoms. In someone who has been using opioids regularly, opioid withdrawal symptoms can happen suddenly after receiving naloxone and may include:

- Body aches
- Diarrhea
- Increased heart rate
- Fever
- Runny nose
- Sneezing
- Goose bumps
- Sweating
- Yawning
- Nausea or vomiting
- Nervousness
- Restlessness or irritability
- Shivering or trembling
- Stomach cramping
- Weakness
- Increased blood pressure

The severity and duration of withdrawal depend on the naloxone dose, as well as the patient’s type and severity of opioid dependence.

INSURANCE COVERAGE FOR NARCAN® NASAL SPRAY

- 94% of insured lives in the U.S. have coverage for NARCAN® Nasal Spray*
- Nearly 73% of prescriptions for NARCAN® Nasal Spray have a co-pay of $10 or less†

*NMIT Formulary Analytics. Accessed March 2017
†IMS Health, NPA Extended Insights Audit. Accessed March 2017

IMPORTANT SAFETY INFORMATION

NARCAN® Nasal Spray is contraindicated in patients known to be hypersensitive to naloxone hydrochloride. Seek emergency medical assistance immediately after initial use, keeping the patient under continued surveillance.

Risk of Recurrent Respiratory and CNS Depression: Due to the duration of action of naloxone relative to the opioid, keep the patient under continued surveillance and administer repeat doses of naloxone using a new nasal spray with each dose, as necessary, while awaiting emergency medical assistance.

Risk of Limited Efficacy with Partial Agonists or Mixed Agonists/Antagonists: Reversal of respiratory depression caused by partial agonists or mixed agonists/antagonists, such as buprenorphine and pentazocine, may be incomplete. Larger or repeat doses may be required.

IMPORTANT SAFETY INFORMATION

Precipitation of Severe Opioid Withdrawal: Use in patients who are opioid dependent may precipitate opioid withdrawal characterized by body aches, fever, sweating, runny nose, sneezing, goose bumps (piloerection), yawning, weakness, shivering or trembling, nervousness, restlessness or irritability, diarrhea, nausea or vomiting, abdominal cramps, increased blood pressure and increased heart rate (tachycardia). In some patients, there may be aggressive behavior upon abrupt reversal of an opioid overdose. In neonates, opioid withdrawal may be life-threatening if not recognized and properly treated and may be characterized by convulsions, excessive crying, and hyperactive reflexes. Monitor for the development of opioid withdrawal.
